What is Data-Based Decision Making?

Data-based decision making is the use of data to make decisions that benefit students. It occurs at all levels of MTSS implementation, from individual students to the district level.

It includes a clear process for movement between the tiers, an accessible data system that graphs data, and use of data-based decision rules implemented with fidelity. Explore our MTSS Fidelity of Implementation Rubric to learn more!

Responsiveness

Are decisions about responsiveness based on reliable and valid data that reflect progress toward key goals?

Are decision-making criteria implemented accurately?

Are there a broad base of key personnel involved?

Is the process data-driven?

Is the process operationalized with clear decision rules?

Are data entered in a timely manner?

Are data represented graphically?

Is there a process for setting and evaluating goals?

Avoid being "data rich, information poor" by watching this webinar!
